

CONFIDENTIAL · PREPARED FOR THE CEO

AATS SOLANA ULTRA-SNIPER

Infrastructure & Procurement Report

What to buy, when to buy it, and how to spend for maximum ROI
— a staged, edge-gated execution plan.

Engagement: AATS Solana Meme-Coin Ultra-Sniper · **Stage:** Pre-edge-proof (paper-proven)

Date: 17 June 2026 · **Prepared by:** Agency Runtime (research-grounded, June 2026 pricing)

Core principle: No spend outruns proof. Real capital stays disabled until the edge is proven on real data.

Contents

1. **Executive summary** — the one-page bottom line & the single highest-ROI move
2. **The reality check** — speed, data access, and the Phantom myth (read before spending)
3. **The spending philosophy** — why staged, edge-gated spend is the only high-ROI path
4. **TIER 0 — Prove the edge** (now): budget option vs. best-money-no-object stack
5. **TIER 1 — Trade for real** (after edge proven): execution & custody
6. **TIER 2 — Optional enrichment** (sentiment / de-risk signals)
7. **The "Do NOT buy" list** — where money gets burned
8. **Master comparison tables** — costs, pros & cons, links
9. **Execution roadmap** — phase → spend → milestone
10. **ROI framework** — how to decide every future purchase
11. **Glossary** — plain-English definitions
12. **Sources**

1 · Executive Summary

The AATS bot is **fully built and paper-proven**. What stands between today and real trades is not more code — it is **proof that a real edge exists**, measured on real market data, *before* any capital is risked. This report tells you exactly what to acquire to get that proof, what to acquire to trade once proven, and — just as importantly — **what not to buy yet**.

\$0

needed to start proving the edge right now (free real-time feed)

~\$1–6k/mo

best-in-class edge-proof stack, ignoring budget

~\$550–

800/mo

+ SOL, realistic monthly cost once trading for real

★ **The single highest-ROI move:** Buy **Bitquery enterprise archival data** (a resolved historical universe of pump.fun launches) and run the edge proof **this week** instead of waiting weeks for live data to accrue. It is the one purchase that buys *time-to-answer* — the most valuable thing at this stage. Pair it with **Helius LaserStream (Professional, \$999/mo)** for a no-gap live feed. Everything else can wait for the verdict.

⚠ **The honest constraint:** Independent 2026 benchmarks show **only ~10% of Solana sniper bots are consistently profitable**. The edge is currently **UNPROVEN**. Money can buy a *faster, cleaner answer* to "does an edge exist?" — it cannot buy a yes. That is exactly why we prove before we spend on execution infrastructure.

2 · The Reality Check (read before spending a cent)

Three widely-sold myths cause the most wasted money in this space. Clearing them up protects your budget.

Myth 1 — "Microsecond" trading

False — and a red flag. Solana produces a block every **~400 milliseconds**. The fastest, most expensive bots on earth react in **sub-40ms**, and only with servers co-located next to validators. A strong retail setup reacts in **~50–300ms**. **Microsecond trading does not exist on Solana for anyone.** Any product promising "microseconds" is misleading you. The real game is *milliseconds, and being faster than rival bots* — not magic.

Myth 2 — "The AI already has a live feed"

The **bot** accesses live Solana data — through infrastructure **you provision**. This was already **proven**: on a free Helius key, the bot decoded **real pump.fun mainnet launches**, point-in-time correct. It is real — just rate-limited on the free tier. Upgrading the feed (this report) turns "real but slow" into "real and competitive."

Myth 3 — "You need Phantom"

You do not need Phantom — at all. Phantom is a *human* browser wallet. An automated bot signs with its **own dedicated keypair** inside an isolated signer (by design: your key never lives in Phantom or in the bot's memory). **Do not buy, connect, or worry about Phantom.**

What you asked about	Can the bot access it?	How
pump.fun live launches & data	YES	Decoded directly from the blockchain (every launch, no middleman) + optional Bitquery/PumpPortal feeds
Jupiter live quotes/routing	YES	Wired to the Jupiter v6 API for quotes & exits
All memecoins + token info	YES	On-chain decode + enrichment APIs (Birdeye / DexScreener)
Phantom	N/A	Not used by bots. The bot has its own signer. Ignore it.

3 · The Spending Philosophy — Staged, Edge-Gated Spend

The whole architecture is built to **spend money only after the previous spend has been justified by proof**. This is the highest-ROI structure possible for a venture with an unproven edge.

Stage	You spend on...	Unlocked only after...	Monthly \$
TIER 0 Prove the edge	A clean real-data feed + historical corpus	Now — no precondition	\$0 → ~\$1–6k
TIER 1 Trade for real	Premium RPC/Geyser, VPS, custody, Jito tips, SOL	Edge proven GO on recorded data	~\$550–800 + SOL
TIER 2 Enrichment	Social/news/sentiment APIs (de-risk only)	Optional — never required to trade	\$0 → ~\$250
PREMIUM Compete	Dedicated/staked nodes, ShredStream, co-lo	Edge proven AND scaling capital	~\$3–6k+

The ROI rule in one line: *Every dollar of spend must be unlocked by a milestone the previous dollar proved.* Spending on Tier-1 or Premium infrastructure **before** the edge is proven is the #1 way money is burned in this business.

4 · TIER 0 — Prove the Edge (do this now)

Goal: record a **clean, complete, point-in-time-correct corpus** of genuine launches *with their outcomes*, then run the leak-free walk-forward edge proof. For this phase the priority is **fidelity + outcomes**, *not* raw speed.

4.1 — The budget path (recommended to start: ~\$0–49/mo)

Option	What it gives	Cost	Link
PumpPortal WebSocket	Free real-time pump.fun new-token + trade stream (purpose-built). Best free option for recording.	Free	pumpportal.fun/data-api
Bitquery free tier	Real-time + some historical (GraphQL/WS). Good for a first corpus.	Free → paid	bitquery.io/products/pumpfun-api
Helius Developer	Better rate limits than free; still WS/RPC (not gRPC). Marginal upgrade for recording.	\$49/mo	helius.dev/pricing

Recommendation: start at **\$0** with PumpPortal's free WebSocket. It fixes the exact bug we hit (the free Solana WS not pushing reliably) and lets you record a clean corpus for free. **Do not spend until the edge proof says GO.**

4.2 — The best stack, ignoring budget (highest fidelity + fastest answer)

For an edge proof you can **fully trust**, the best is a **two-source stack** — a fidelity leg and a historical leg — because you need both *zero dropped events* and *launches that have already resolved* (so you can label outcomes without waiting weeks).

A · Live full-firehose recorder (fidelity leg)

Provider	Why	Cost	Pros / Cons
Triton One Dedicated Yellowstone gRPC	Triton <i>created</i> Yellowstone gRPC — the reference-quality full-firehose implementation, best at backpressure without dropping transactions.	from ~\$2,900/mo (custom/enterprise)	+ Reference fidelity, full firehose, no drops – Highest cost; more ops
Helius LaserStream Professional plan	Drop-in Yellowstone replacement; guarantees no gaps (with replay), 24h historical replay, auto-reconnect, zero node maintenance.	\$999/mo	+ No-gap guarantee, lightest ops, the bot already speaks it – Slightly less "raw" than a dedicated node

The bot's `GeyserTransport` + vendored Yellowstone proto + `INFRA_TIER=dedicated_geyser` are already built for this. Money just unlocks a working `GEYSER_ENDPOINT`; the code path exists.

B · Historical archival backfill (the highest-leverage buy)

Provider	Why it's the killer purchase	Cost	Pros / Cons
Bitquery Enterprise (archival dumps)	Bulk dumps of all pump.fun + PumpSwap launches & trades since May 2024 to your own S3 / Snowflake / BigQuery. ~157B Solana rows/week. Gives you thousands of already-resolved launches today → edge proof runs this week , not in 6 weeks.	Custom (enterprise quote)	+ Collapses weeks of waiting into days; resolved outcomes for labels; cross-checks the live feed – Custom pricing; you must still enforce no-lookahead in the backtest

C · Earliest-signal overlay (optional, for honesty)

Jito ShredStream on the live recorder sees swap activity **~50–100ms earlier** than Yellowstone gRPC. Already wired (`SHREDSTREAM_ENDPOINT`). For the edge proof it matters because it records *how early you could have acted* — which directly affects whether an edge exists. (Ignore "2 minutes earlier" marketing claims — the honest figure is 50–100ms.)

4.3 — Why this stack is the best for corpus quality

Edge-proof requirement	How the stack delivers it
Completeness (no survivorship gaps)	Triton/LaserStream full firehose — no rate-limit drops; every genuine launch captured
Outcomes to label NOW	Bitquery archival → resolved history, no waiting for live accrual
Point-in-time honesty (no train/serve skew)	Record on the <i>exact production gRPC path</i> you'll later trade on
Bug / leak detection	Two independent sources (live vs archival) cross-check the decoder
Earliest-detectable realism	ShredStream overlay timestamps the true first-seeable moment

What money still cannot buy here: (1) Clean data ≠ a leak-free backtest — the purged/embargoed walk-forward rigor is what makes the verdict trustworthy. (2) The verdict can still be **NO-GO**. You are buying a faster, cleaner *answer* — not a positive one.

5 · TIER 1 — Trade For Real (only after edge proven)

Unlocked **only** when the edge proof returns GO on recorded data. This is the execution + custody layer.

Item	Why	Cost	Notes
Premium RPC + Geyser Helius Business / Pro (or Triton)	Low-latency real-time firehose (LaserStream gRPC). The "real but slow → fast enough" upgrade.	\$499–999/mo	Business (\$499) unlocks LaserStream gRPC (10 concurrent connections, from Apr 2026)
Low-latency VPS	Server near the Jito block engine / validators (e.g. Frankfurt, Amsterdam, NY) to cut network hops.	\$50–150/mo	Cloud VPS; bare-metal co-lo costs more
Jito (bundles)	Bundle submission + MEV protection.	Per-trade SOL tips	No subscription — dynamic tips priced in SOL per trade
HashiCorp Vault	Holds the wallet secret (the bot's custody design uses it).	\$0 self-host	HCP Vault Cloud is a paid alternative
Funded trade wallet	The actual SOL you trade.	Your capital	Design caps it at ≤ 2 SOL at launch to bound risk (blast-radius control)

Capital staging (built into the bot): paper → **tiny-real** (e.g. \$50–200 risk) → scale. Even after a GO verdict, the first real trades are deliberately tiny, to confirm simulation matches reality (slippage, land-rate, adverse selection) before any meaningful size.

6 · TIER 2 — Optional Enrichment (not required to trade)

The bot runs **fully without any of these** (it ships with offline mocks). They only add the "SLOW-loop" social/news layer, which can **only lower conviction (de-risk)** — it never trades for you. Add later, if ever.

Service	Role	Cost	Link
DexScreener	Token price/liquidity enrichment	Free	docs.dexscreener.com
Birdeye	Deeper token/market data	Free tier + paid	docs.birdeye.so
X (Twitter) API	Social sentiment (recent search)	~\$200/mo (Basic) verify current	developer.twitter.com

Service	Role	Cost	Link
Reddit API	Subreddit sentiment	Free	reddit.com/dev/api
Discord bot	Alpha-channel monitoring (allowlist only)	Free	discord.com/developers
NewsAPI.org	Breaking-news de-risk signal	Free (100/day)	newsapi.org
LLM key (OpenAI / local Ollama)	SLOW-loop reasoner (de-risk adjudication only)	Usage-based / \$0 local	platform.openai.com

7 · The "Do NOT Buy (yet)" List — where money gets burned

Tempting purchase	Why NOT (yet)
Dedicated node ~\$2,900/mo + staked RPC + co-location	This is the <i>competitive</i> tier the top ~10% run. Burning ~\$3k/mo before the edge is proven is setting money on fire. Only after GO + scaling.
Phantom / any wallet product	Not used by bots. The bot has its own signer.
Any "sniper bot" subscription / SaaS	You are building your own — paying for a black box duplicates and undermines that.
Premium social/sentiment APIs up front	SLOW-loop, de-risk-only. They never create edge. Add post-GO if at all.
"Microsecond" anything	Doesn't exist on Solana. A marketing red flag.

8 · Master Comparison Table — Costs, Pros & Cons, Links

Provider / Item	Tier	Cost	Pros	Cons
PumpPortal WS	0	Free	Purpose-built pump.fun real-time; zero cost; fast to wire	pump.fun-centric; not a full-chain firehose
Bitquery (free)	0	Free→paid	Real-time + historical; multi-channel (WS/gRPC/Kafka)	Free tier rate-limited
Bitquery Enterprise archival	0★	Custom	Resolved history since 2024 → edge proof in days; S3/Snowflake dumps	Custom price; lookahead still your responsibility
Helius Developer	0	\$49/mo	Cheap rate-limit bump	No gRPC; marginal for recording
Helius Business	1	\$499/mo	Unlocks LaserStream gRPC (10 conns); great value	Data add-ons are Pro-only
Helius LaserStream Pro	0★/1	\$999/mo	No-gap guarantee; 24h replay; zero ops; bot already speaks it	Pricier than Business
Triton One dedicated gRPC	0★/Prem	~\$2,900/mo	Reference Yellowstone fidelity; best firehose/backpressure	Highest cost; more ops
Helius dedicated node	Prem	from ~\$2,900/mo	Designed for gRPC streaming; staked-adjacent	No webhooks/archival; combine w/ shared plan
Jito bundles + ShredStream	1	SOL tips / infra	MEV protection; earliest shred view (50–100ms)	Per-trade tips; ShredStream needs proper infra
Low-latency VPS	1	\$50–150/mo	Cuts hops to block engine	Region choice matters; bare-metal costs more
HashiCorp Vault	1	\$0 self-host	Proper secret custody; in the design	Self-host ops; HCP cloud paid
DexScreener	2	Free	Free enrichment	Rate limits
Birdeye	2	Free→paid	Rich market data	Paid tiers for volume
X API Basic	2	~\$200/mo	Social sentiment input	De-risk only; never edge; price volatile

★ = also valid as the best money-no-object choice for the edge-proof phase.

9 · Execution Roadmap — Phase → Spend → Milestone

Phase	What happens	Spend	Gate to next	Time
1. Fix feed	Switch ingestion to a reliable real-time source; fix today's bug	\$0 (PumpPortal)	Clean events flowing	2–5 days
2. Record corpus	Accumulate genuine launches + outcomes (or buy Bitquery archival to skip the wait)	\$0 → custom	Enough labeled launches	Days–6 wks
3. Edge proof 	Leak-free walk-forward; model vs baseline, net of all costs	—	GO / NO-GO	1–3 wks
4. Build execution	Real signer, custody, live swap landing, tip economics, security audit	Eng time	Security PASS	2–4 wks
5. Tiny-real	First real trades at minimal size; confirm sim = reality	RPC+VPS+SOL	Sim matches live	1–2 wks
6. Your gates	Funding, jurisdiction, sign-off	Your capital	Scale decision	Your call

 **Phase 3 is the boss gate.** If the edge proof returns NO-GO, you **stop or pivot** — you do not advance to Phases 4–6. This is the design protecting your capital. Everything before Phase 3 is intentionally cheap so a NO-GO costs you very little.

10 · ROI Framework — How to Decide Every Future Purchase

Before any spend, ask these four questions in order. If the answer to any is "no", don't buy yet.

- 1. Is this unlocked by a milestone I've already proven?** (e.g., don't buy execution infra before edge proof.)
- 2. Does it move a metric that decides GO/NO-GO, or does it only help *after* GO?** Edge-proof spend (Tier 0) is the highest ROI because it produces the *decision*. Post-GO spend only matters if there's a GO.
- 3. Is it the cheapest thing that fully answers the question?** A free feed that proves the edge beats a \$3k feed that proves the same edge.
- 4. Does it reduce risk or only chase speed?** Custody, caps, and the safety stack are always worth it. Raw speed is only worth it once an edge exists to exploit.

Highest ROI

Tier-0 edge-proof data — it produces the GO/NO-

Conditional ROI

Negative ROI (now)

GO decision itself

Tier-1 execution & custody
— valuable only after a GO
verdict

Premium co-lo / dedicated
nodes before edge is
proven

11 · Glossary (plain English)

RPC	The "phone line" your bot uses to talk to the Solana blockchain (read data, send trades).
Geyser / Yellowstone gRPC	A high-speed "firehose" stream of everything happening on-chain, in real time. The bot is built for this.
LaserStream	Helius's managed version of that firehose, with a "no missed data" guarantee.
ShredStream	An even-earlier view of transactions (50–100ms sooner), via Jito.
Jito / bundles / tips	A system to submit trades with priority and MEV protection; you pay a small "tip" in SOL per trade.
SWQoS (stake-weighted QoS)	Priority access to validators based on stake — how pro bots get their trades in first.
Edge	A real, repeatable money-making advantage — <i>after</i> all costs (fees, tips, slippage). The thing we must prove.
Edge proof / walk-forward	A rigorous historical test that the strategy beats a simple baseline without "cheating" by seeing the future (no lookahead).
Point-in-time / no lookahead	Only using information that was actually available at the moment of decision. Critical for an honest test.
Corpus	The recorded dataset of launches the edge proof runs on.
DRY_RUN	The hard safety switch: the bot simulates everything and touches no real money until you explicitly authorize it.
Custody / signer / Vault	How the trading key is stored and used safely, isolated from the rest of the bot.
Co-location	Renting a server physically near the validators to shave milliseconds. Expensive; only worth it once an edge exists.
